

Barrier certificate and post-H1 retained-basis outcomes

Certified counterexample path

The barrier certificate checks 55,954 depth-1 single actuators. No depth-1 actuator improves the seed; only the retained radius-1, depth-2 cone class escapes, and the first certified edge is [3,7]. The same six-packet end state recurs in the hypergraph, lattice-gas, and orbit branches.

Cells show the best support/11/max triple when a method improves; '=' means no change from the start state.
